

# SSL/TLS ACME automation in Sectigo Certificate Manager (SCM)

Explore ACME-driven automation while gaining centralized certificate visibility in SCM

**The Automatic Certificate Management Environment (ACME)** is the industry's go-to protocol for automating public SSL/TLS certificate issuance and renewal. Google and other major platforms point to ACME as essential for managing shorter certificate lifespans, helping organizations improve uptime, agility, and readiness for post-quantum cryptography.

If you're adopting an ACME-first strategy within your organization, Sectigo Certificate Manager (SCM) makes it easy to automate across a wide range of compatible technologies.

We've included examples of ACME-compatible systems and clients that integrate well with SCM, either through trusted ACME clients or native, out-of-the-box integrations.

**Use this cheat sheet as a reference point when mapping your environment and identifying where ACME fits, and where to extend beyond it.**

*Note that there will always be some technologies that cannot be fully automated. Some systems may still require partial or manual workflows, but most can be automated with the right method.*

While ACME is a powerful standard, it's not universal. In addition to native ACME support, SCM offers flexible automation through SCEP, EST, REST APIs, agents, connectors, and third-party integrations. This means you can automate certificates across a wide range of environments, even those that don't natively support ACME. This flexibility ensures broad compatibility across modern, hybrid, and legacy environments.

## Web servers / load balancers / firewalls

| Vendor    | Application | Native ACME support | ACME client used                          | ACME docs                                                                                           | Sectigo-built integration | Sectigo integration type                         | Sectigo integration docs                                       |
